ECHOPANEL PRINTS
&
EDGE-MATCHING

Our Standard EchoPanel Prints panels are hand-silk screened in order to get detailed depth, texture and color coverage. Due to this process, it is not currently possible to perfectly edge-match panels to create a single consistent pattern across multiple panels.

For multiple panel installations, we recommend one of the following:

- Reveals between panels: By direct mounting to wall with reveal between panels. We recommend mounting systems such as Wall Panel Systems (www.wallpanelsystems.net).
- Trim between panels, such as aluminum t-mold. We recommend visiting www.fryreglet.com for trim.
- Pre-cut strips of EchoPanel used as dividers between each panel to maintain color continuity between panels.
- Grout border between panels, We recommend Loctite PowerGrab Clear, which should be installed at 3/16"-1/4" gap and caulk seam by masking off with blue tape (typically requires two passes).

Orientation varies between sheet sizes and thicknesses, so please be sure that the panels you select meet your needs. Verify both the net cut sheet size and pattern orientation when selecting a color and pattern. Also be sure that the desired pattern orientation matches with the panel thickness you need.

Custom digital printing on panels is also available.

Please call Kirei if you have further questions or need these details sent to a general contractor or preferred installer.
